

Package ‘BayesSPsurv’

September 9, 2020

Type Package

Title Bayesian Spatial Split Population Survival Model

Version 0.1.8

Author Brandon L. Bolte [aut], Nicolas Schmidt [aut, cre], Sergio Bejar [aut], Bumba Mukherjee [aut], Minnie M. Joo [ctb], Nguyen K. Huynh [ctb]

Description Bayesian parametric spatial split-population survival models for clustered event processes. The models account for both structural and spatial heterogeneity among “at risk” and “immune” populations, and incorporates time-varying covariates. This package currently implements Weibull, Exponential and Log-logistic forms for the duration component, and includes functions for a series of diagnostic tests and plots to easily visualize convergence and spatial effects. The user can also create their own spatial weights matrix based on their units and adjacencies of interest, making the use of these models flexible and broadly applicable to a variety of research areas.

capdist	<i>Gleditsch and Ward Distance data</i>
---------	---

Description

Dyadic dataset extracted from [Gleditsch and Ward \(2001\)](#). The dataset contains information on the distance between capital cities among independent nation-states.

Usage

data(capdist)

Format

A data frame with 41006 rows and 6 variables

Details

- numa** COW code – country A.
- ida** Three letter ISO code – country A.
- numb** COW code – country B.
- idb** Three letter ISO code – country B.
- kmdist** Distance between capital cities in the kilometers.
- midist** Minimal distance between capital cities in the kilometers.

exchangeSPsurv

*exchangeSPsurv***Description**

Markov Chain Monte Carlo (MCMC) to run Bayesian split population survival model with exchangeable frailties.

Returns a summary of a exchangeSPsurv object via `summary.mcmc`.

Print method for a `exchangeSPsurv` x.

Returns a plot of a exchangeSPsurv object via `plot.mcmc`.

Usage

```
exchangeSPsurv(
  duration,
  immune,
  Y0,
  LY,
  S,
  data,
  N,
  burn,
  thin,
  w = c(1, 1, 1),
  m = 10,
  form = c("Weibull", "exponential", "loglog"),
  prop.var
)

## S3 method for class 'frailtySPsurv'
summary(object, parameter = c("betas", "gammas", "lambda"), ...)

## S3 method for class 'frailtySPsurv'
print(x, ...)

## S3 method for class 'frailtySPsurv'
plot(x, ...)
```

Arguments

duration	survival stage equation written in a formula of the form $Y \sim X1 + X2 + \dots$ where Y is duration until failure or censoring.
immune	split stage equation written in a formula of the form $C \sim Z1 + Z2 + \dots$ where C is a binary indicator of immunity.
Y0	the elapsed time since inception until the beginning of time period (t-1).
LY	last observation year (coded as 1; 0 otherwise) due to censoring or failure.
S	spatial information (e.g. district ID) for each observation that matches the spatial matrix row/column information.

data	data.frame.
N	number of MCMC iterations.
burn	burn-in to be discarded.
thin	thinning to prevent from autocorrelation.
w	size of the slice in the slice sampling for (betas, gammas, rho). Write it as a vector. E.g. c(1,1,1).
m	limit on steps in the slice sampling. A vector of values for beta, gamma, rho.
form	type of parametric model (Weibull, Exponential, or Log-Logistic).
prop.var	proposed variance for Metropolis-Hastings.
object	an object of class frailtySPsurv, the output of exchangeSPsurv .
parameter	one of three parameters of the pooledSPsurv output. Indicate either "betas," "gammas," or "lambda."
...	additional parameter.
x	an object of class frailtySPsurv, the output of exchangeSPsurv .

Value

exchangeSPsurv returns an object of class "exchangeSPsurv".

A "exchangeSPsurv" object has the following elements:

betas	matrix, numeric values of the posterior for each variable in the duration equation.
gammas	matrix, numeric values of the posterior for each variable in the immune equation.
rho	numeric vector of values for rho.
lambda	numeric, vector of values for lambda.
delta	numeric, vector of values for delta.
W	matrix, numeric values of the posterior for Ws
V	matrix, numeric values of the posterior for Vs
X	matrix X's variables.
Z	matrix of Z's variables.
Y	the vector of 'Y'.
Y0	the vector of 'Y0'.
C	the vector of 'C'.
S	the vector of 'S'.
form	character, type of distribution.
call	description for the model to be estimated.

list. Empirical mean, standard deviation and quantiles for each variable.

list. Empirical mean, standard deviation and quantiles for each variable.

Examples

```
walter <- spduration::add_duration(Walter_2015_JCR,"renewed_war",
                                   unitID = "id", tID = "year",
                                   freq = "year", ongoing = FALSE)

# add S
walter <- spatial_SA(data = walter, var_ccode = "ccode", threshold = 800L)

set.seed(123456)

model <-
  exchangeSPsurv(
    duration = duration ~ fhcomp1 + lgdp1 + comprehensive + victory +
    instabl + intensityln + ethfrac + unpko,
    immune   = cured ~ fhcomp1 + lgdp1 + victory,
    Y0       = 't.0',
    LY       = 'lastyear',
    S        = 'sp_id' ,
    data     = walter[[1]],
    N        = 100,
    burn     = 10,
    thin     = 10,
    w        = c(1,1,1),
    m        = 10,
    form     = "loglog",
    prop.var = 1e-05
  )

print(model)

summary(model, parameter = "betas")

plot(model)
```

pooledSPsurv

pooledSPsurv

Description

Markov Chain Monte Carlo (MCMC) to run Bayesian split population survival model with no frailties.

Returns a summary of a SPsurv object via [summary.mcmc](#).

Print method for a [pooledSPsurv](#) x.

Returns a plot of a pooledSPsurv object via [plot.mcmc](#).

Usage

```
pooledSPsurv(
  duration,
  immune,
  Y0,
  LY,
  data,
  N,
  burn,
  thin,
  w = c(1, 1, 1),
  m = 10,
  form = c("Weibull", "exponential", "loglog")
)

## S3 method for class 'SPsurv'
summary(object, parameter = c("betas", "gammas", "lambda"), ...)

## S3 method for class 'SPsurv'
print(x, ...)

## S3 method for class 'SPsurv'
plot(x, ...)
```

Arguments

duration	survival stage equation written in a formula of the form $Y \sim X1 + X2 + \dots$ where Y is duration until failure or censoring.
immune	split stage equation written in a formula of the form $C \sim Z1 + Z2 + \dots$ where C is a binary indicator of immunity.
Y0	the elapsed time since inception until the beginning of time period (t-1).
LY	last observation year (coded as 1; 0 otherwise) due to censoring or failure.
data	data.frame.
N	number of MCMC iterations.
burn	burn-in to be discarded.
thin	thinning to prevent from autocorrelation.
w	size of the slice in the slice sampling for (betas, gammas, rho). Write it as a vector. E.g. c(1,1,1).
m	limit on steps in the slice sampling. A vector of values for beta, gamma, rho.
form	type of parametric model (Weibull, Exponential, or Log-Logistic).
object	an object of class SPsurv, the output of pooledSPsurv .
parameter	one of three parameters of the pooledSPsurv output. Indicate either "betas," "gammas," or "lambda."
...	additional parameter.
x	an object of class SPsurv, the output of pooledSPsurv .

Value

pooledSPsurv returns an object of class "pooledSPsurv".

A "pooledSPsurv" object has the following elements:

betas	matrix, numeric values of the posterior for each variable in the duration equation
gammas	matrix, numeric values of the posterior for each variable in the immune equation.
rho	numeric vector of values for rho.
delta	numeric, vector of values for delta.
W	matrix, numeric values of the posterior for Ws
V	matrix, numeric values of the posterior for Vs
X	matrix X's variables.
Z	matrix of Z's variables.
Y	the vector of 'Y'.
Y0	the vector of 'Y0'.
C	the vector of 'C'.
form	character, type of distribution.
call	description for the model to be estimated.

list. Empirical mean, standard deviation and quantiles for each variable.

Examples

```
walter <- spduration::add_duration(Walter_2015_JCR,"renewed_war",
                                  unitID = "id", tID = "year",
                                  freq = "year", ongoing = FALSE)

set.seed(123456)

model <-
  pooledSPsurv(
    duration = duration ~ fhcompor1 + lgdp1 + comprehensive + victory +
      instabl + intensityln + ethfrac + unpko,
    immune   = cured ~ fhcompor1 + lgdp1 + victory,
    Y0       = 't.0',
    LY       = 'lastyear',
    data     = walter,
    N        = 100,
    burn     = 10,
    thin     = 10,
    w        = c(1,1,1),
    m        = 10,
    form     = "Weibull"
  )

print(model)
```

```
summary(model, parameter = "betas")

plot(model)
```

spatialSPsurv

spatialSPsurv

Description

Markov Chain Monte Carlo (MCMC) to run time-varying Bayesian split population survival model with spatial frailties.

Returns a summary of a exchangeSPsurv object via [summary.mcmc](#).

Print method for a [spatialSPsurv](#) x.

Returns a plot of a spatialSPsurv object via [plot.mcmc](#).

Usage

```
spatialSPsurv(
  duration,
  immune,
  Y0,
  LY,
  S,
  A,
  data,
  N,
  burn,
  thin,
  w = c(1, 1, 1),
  m = 10,
  form = c("Weibull", "exponential", "loglog"),
  prop.var
)

## S3 method for class 'spatialSPsurv'
summary(object, parameter = c("betas", "gammas", "lambda"), ...)

## S3 method for class 'spatialSPsurv'
print(x, ...)

## S3 method for class 'spatialSPsurv'
plot(x, ...)
```

Arguments

duration	survival stage equation written in a formula of the form $Y \sim X1 + X2 + \dots$ where Y is duration until failure or censoring.
----------	---

immune	split stage equation written in a formula of the form $C \sim Z1 + Z2 + \dots$ where C is a binary indicator of immunity.
Y_0	the elapsed time since inception until the beginning of time period (t-1).
LY	last observation year (coded as 1; 0 otherwise) due to censoring or failure.
S	spatial information (e.g. district ID) for each observation that matches the spatial matrix row/column information.
A	an a times a spatial weights matrix where a is the number of unique spatial units (S) load as a separate file.
data	data.frame.
N	number of MCMC iterations.
burn	burn-in to be discarded.
thin	thinning to prevent from autocorrelation.
w	size of the slice in the slice sampling for (betas, gammas, rho). Write it as a vector. E.g. <code>c(1,1,1)</code> .
m	limit on steps in the slice sampling. A vector of values for beta, gamma, rho.
form	type of parametric model (Weibull, Exponential, or Log-Logistic).
prop.var	proposal variance for Metropolis-Hastings.
object	an object of class <code>spatialSPsurv</code> , the output of <code>spatialSPsurv</code> .
parameter	one of three parameters of the pooledSPsurv output. Indicate either "betas," "gammas," or "lambda."
...	additional parameter.
x	an object of class <code>spatialSPsurv</code> , the output of <code>spatialSPsurv</code> .

Value

`spatialSPsurv` returns an object of class "spatialSPsurv".

A "spatialSPsurv" object has the following elements:

betas	matrix, numeric values of the posterior for each variable in the duration equation.
gammas	matrix, numeric values of the posterior for each variable in the immune equation.
rho	numeric vector of values for rho.
lambda	numeric, vector of values for lambda.
delta	numeric, vector of values for delta.
W	matrix, numeric values of the posterior for W s
V	matrix, numeric values of the posterior for V s
X	matrix X 's variables.
Z	matrix of Z 's variables.
Y	the vector of 'Y'.
Y_0	the vector of ' Y_0 '.
C	the vector of 'C'.
S	the vector of 'S'.
form	character, type of distribution.
call	description for the model to be estimated.

list. Empirical mean, standard deviation and quantiles for each variable.

list. Empirical mean, standard deviation and quantiles for each variable.

Examples

```
walter <- spduration::add_duration(Walter_2015_JCR,"renewed_war",
                                  unitID = "id", tID = "year",
                                  freq = "year", ongoing = FALSE)

walter <- spatial_SA(data = walter, var_ccode = "ccode", threshold = 800L)

set.seed(123456)

model <-
  spatialSPsurv(
    duration = duration ~ fhcompor1 + lgdp1 + comprehensive + victory +
                        instabl + intensityln + ethfrac + unpko,
    immune   = cured ~ fhcompor1 + lgdp1 + victory,
    Y0       = 't.0',
    LY       = 'lastyear',
    S        = 'sp_id' ,
    data     = walter[[1]],
    N        = 500,
    burn     = 10,
    thin     = 10,
    w        = c(1,1,1),
    m        = 10,
    form     = "Weibull",
    prop.var = 1e-05,
    A        = walter[[2]]
  )

print(model)

summary(model, parameter = "betas")

plot(model)
```

spatial_SA	<i>spatial_SA</i>
------------	-------------------

Description

matrix A and sp_id (S)

Usage

```
spatial_SA(data, var_ccode, threshold = 800L)
```

Arguments

data	data.frame.
var_ccode	name of the variable that contains the country codes.
threshold	distance in kilometers.

Value

list. Contains database with variable `sp_id` (S) and matrix A.

Examples

```
walter <- spduration::add_duration(Walter_2015_JCR, "renewed_war",
                                   unitID = "id",
                                   tID = "year",
                                   freq = "year",
                                   ongoing = FALSE)

walter <- spatial_SA(data = walter,
                     var_ccode = "ccode",
                     threshold = 800L)
```

SPstats	<i>SPstats</i>
---------	----------------

Description

A function to calculate the deviance information criterion (DIC) and Log-likelihood for fitted model outputs of pooled, exchangeable, and spatial Split Population survival models for which a log-likelihood can be obtained, according to the formula $DIC = -2 * (L - P)$, where L is the log likelihood of the data given the posterior means of the parameter and P is the estimate of the effective number of parameters in the model.

Usage

```
SPstats(object)
```

Arguments

object	An object of the output of pooled, exchangeable, or spatial Split Population survival model .
--------	---

Value

List.

Walter_2015_JCR

Walter_2015_JCR

Description

Subsetted version of a time-series-cross-sectional (TSCS) dataset used in [Walter \(2015\)](#). It has data on duration of post-war peace as well as information on other relevant economic and political data. The variables `duration`, `cured`, `t.0` and `lastyear` added by the authors of this package using the function `add_duration`.

Usage

```
data(Walter_2015_JCR)
```

Format

A data frame with 1237 rows and 8 variables

Details

fhcompor1 Freedom House civil liberties index.

lgdpl log of per capita GDP in 2005 dollars.

comprehensive combatants signed comprehensive peace agreement.

victory end of previous war with outright victory.

instabl dummy that indicates whether there was a positive or negative change in the Polity 2 score in the previous country-year.

intensityln deaths per year – logged.

ethfrac index of ethnic fractionalization.

unpko number of UN peacekeepers on the ground.
